Tree

Tree + Tab Generator

The two principally interact with the `consult_tree` and `generate_tab_dictionary` methods in `tab_generator.py`

1. `generate_tab_dictionary` will be modified to first call `consult_tree` to analyze if any patterns can be applied to the notes provided.
2. The effects of this are:
 1. the `notes` parameter that `generate_tab_dictionary` takes will now be a mix of instances of the `Note` class and `FretboardPositions`
 2. one of these 2 will have to be modified as such:
 1. `generate_tab_dictionary` will use the `continue` keyword to skip over `FretboardPosition` instances
 2. OR `get_best_next_position` will be modified to return the `FretboardPosition` instance passed to it (thus making no changes)
